A suitable leaving group Y in a starting material of the formula II is preferably halogen, such as bromine, iodine or, in particular, chlorine.

The end substances of the formula I can contain substituents which can also be used as protective groups in starting substances for the preparation of other end substances of the formula I. Unless otherwise evident from the context, "protective groups" in this text, are therefore only those easily detachable groups which are not a constituent of the particular desired end substance of the formula I.

"e"

Protective groups, their introduction and their detachment are described, for example, in "Protective Groups in Organic Chemistry", Plenum Press, London, New York 1973, and in "Methoden der organischen Chemie" [Methods of Organic Chemistry], Houben-Weyl, 4th Edition, Volume 15/1, Georg-Thieme-Verlag, Stuttgart 1974 and in T. W. Greene, "Protective Groups in Organic Synthesis", John Wiley & Sons, New York 1981. It is characteristic of protective groups that they can be detached easily, i.e. without undesirable side reactions taking place, for example by solvolysis, reduction, photolysis or also under physiological conditions.

Protection of free functional groups in the starting material of the formula II is as a rule not necessary. If desired, free carboxyl or amino groups in the radical R₁ or free amino groups in the radical R₃ can be protected.

In a starting material of the formula III, if desired, for example, free amino groups, with the exception of the amino group participating in the reaction, or free carboxyl groups, can be present in protective form. Protection of some functional groups, for example a second amino group in the amine of the formula III, for example in the case of ethylenediamine, can be avoided by employing the amine of the formula III in a large excess. Functional groups, such as, in particular, leaving groups, for example halogen or toluenesulfonate, however, can also be present, in accordance with the principle of latent functionality, in a form which can be converted into one of the functional groups according to formula I. Thus, a protected amino group can first be set free by detaching the amino-protective group and the free amino group can then be converted into toluenesulfonate or halogen via an azide in a manner known per se.
